# Executive Summary

This report summarizes groundwater monitoring action activities completed between January 1 and December 31, 2023 at the Coal Combustion Residuals (CCR) Ash Monofill at the Platte River Power Authority (Platte River) Rawhide Energy Station (Rawhide Station or Site), as required by 40 Code of Federal Regulations (CFR) Section 257.90(e) of the United States Environmental Protection Agency (USEPA) CCR Rule. The location of the CCR unit and program monitoring network for the CCR unit, including supporting monitoring wells, are illustrated on **Figure 1**. No program monitoring wells were modified or abandoned during the reporting period.

At the start of the 2023 reporting period, Platte River was operating the Ash Monofill under the Assessment monitoring program outlined in 40 Code of Federal Regulations (CFR) Section 257.95. The Assessment monitoring program for the Ash Monofill was initiated on April 30, 2018 upon submittal of an Appendix III Constituents Alternate Source Demonstration which was unable to identify alternate sources for the statistically significant increases (SSIs) of Appendix III constituents downgradient of the Ash Monofill (AECOM 2018b). In the 2023 reporting period, monitoring data reported the detections of the following Appendix III constituents in downgradient monitoring wells at concentrations that represent verified SSIs over background:

- Boron in each of the downgradient monitoring wells within the Ash Monofill network
- Calcium in monitoring wells ASH-03, ASH-04, ASH-05, ASH-07, and ASH-08
- Chloride in monitoring wells ASH-03, ASH-04, ASH-05, ASH-07, and ASH-08
- Sulfate in monitoring wells ASH-03, ASH-04, ASH-05, ASH-07, and ASH-08
- Total dissolved solids (TDS) in monitoring wells ASH-03, ASH-04, ASH-05, ASH-07, and ASH-08

Per CCR rule requirements, groundwater protection standards (GWPS) were established for each detected Appendix IV constituent and the data were tested for whether the monitoring well concentrations represented statistically significant levels (SSLs) above their respective GWPSs. Downgradient wells with a constituent or constituents reported above GWPSs at an SSL are as follows:

- Selenium in monitoring wells ASH-03, ASH-04, and ASH-07.

Other salient points for the 2023 annual reporting period include:

- Semiannual Assessment-mode groundwater monitoring events were conducted in April and October. Monitoring involved sampling of background monitoring wells and downgradient monitoring wells.
- No program transitions (Detection to Assessment or vice versa) were triggered.
- Completed construction of a new engineered landfill cell (referred to as Cell 2B) for ash management in April (AECOM 2024). Cell 2B has an engineered leachate collection system and improved storm water diversion features that may influence groundwater flow and constituent concentrations within the footprint and downgradient of the landfill.

Anticipated activities for the 2024 annual reporting period include:

- Completion of two semi-annual Assessment-mode groundwater monitoring events.
- Statistical evaluation of groundwater data for Appendix III and Appendix IV constituents.
- Evaluation of final remedy selection and implementation. Evaluation will include determining if adequate monitoring data, hydrogeological data, contaminant migration pathways information, and contaminant exposure pathways information are available to make the final remedy selection. The evaluation will also consider any influence the newly engineered landfill Cell 2B may have on groundwater flow and constituent concentrations.

## 1.0 Introduction

This is the 2023 Annual Groundwater Monitoring and Corrective Action Report for the Coal Combustion Residuals (CCR) Ash Monofill at the Platte River Power Authority (Platte River) Rawhide Energy Station (Rawhide Station or Site) in Larimer County, Colorado. This report was developed by AECOM Technical Services, Inc. (AECOM) at the request of Platte River. The purpose of this report is to provide a summary of the groundwater monitoring activities performed at the Ash Monofill in 2023 to comply with the requirements of Title 40 of the Code of Federal Regulations (CFR) Part 257 Subpart D, known as the CCR Rule, which became effective on October 19, 2015. The Rule provides standards for the disposal of CCR in landfills and surface impoundments (CCR units) and establishes groundwater monitoring requirements in 40 CFR 257.90 through 257.94. In accordance with 40 CFR 257.90(e), an annual report must document the status of the groundwater monitoring and correction action program (as applicable) for the CCR unit, summarize the key actions completed the previous year, describe any problems encountered, discuss actions taken to resolve the problems, and project key activities for the upcoming year. The annual report will be considered complete when it is placed in the facility operating record by January 31, 2024.

### 1.1 Report Organization

This Annual Report is divided into eight sections as outlined below and includes text, tables, figures, and appendices. The sections include:

- Section 1.0 includes this introduction and report organization.
- Section 2.0 provides a facility description that includes the facility location and operational history, a description of the CCR unit and a summary of the areal and site hydrogeology.
- Section 3.0 summarizes the groundwater monitoring and corrective action activities performed in 2023, and references appendices to this report that contain detailed documentation of those activities.
- Section 4.0 summarizes the groundwater sampling, analyses and results.
- Section 5.0 provides the statistical analyses and results.
- Section 6.0 provides a projection of the key activities anticipated in 2024.
- Section 7.0 provides a summary of findings.
- Section 8.0 provides a list of references cited in the report.

The report also includes four appendices that provide supporting documentation of the groundwater monitoring and related activities conducted in 2023:

- Appendix A – Groundwater Sampling Forms.
- Appendix B – Laboratory Analytical Reports and Data Validation Reports.
- Appendix C – Groundwater Velocity Calculation Sheet
- Appendix D – Statistical Analysis Results and Input/Output Files.

## 2.0 Facility Description

### 2.1 Facility Location and Operational History

The Rawhide Station encompasses approximately 4,560 acres north of Wellington in Larimer County, Colorado. In addition to the plant buildings, the major feature of the facility is an approximately 500-acre dry-land construction reservoir of reclaimed wastewater from the City of Fort Collins, also known as Hamilton Reservoir, which contains approximately 15,000 acre-feet of water and is used for cooling processes. The power block area contains the boiler and turbine buildings, the air quality control equipment, and the administrative offices. A rail spur along the northern edge of the Site connects the Rawhide Facility with the mainline of the Burlington Northern Santa Fe Railway Company and is used to deliver coal and construction materials for plant operations. Six generating units are located at the Rawhide Station. Units A, B, C, D, and F are fueled by natural gas, and Unit 1 is fueled by coal mined from the Powder River Basin in Wyoming.

### 2.2 Ash Monofill Description

The Ash Monofill is located northwest of the main plant and north of Hamilton Reservoir. CCR solid waste from Unit 1 operations is disposed of in the Ash Monofill which is comprised of two cells, Cell 1 and Cell 2, as shown on **Figure 1**. Cell 1 was operated from approximately 1980 to 2007 and is no longer in use. It is capped with cover soils but has not undergone final closure. Cell 2 is active, lies to the west of Cell 1, and is progressively advancing northwards as further ash material is placed within the cell. In 2023, a lined Cell 2B was completed, which contains a leachate collection system. CCR waste generated post completion of liner is placed in the lined portion of the cell. The footprint of the lined Cell 2B is presented in **Figure 1**.

### 2.3 Rawhide Station Hydrogeology

The hydrogeology of the Rawhide Station is discussed in the Engineering Report and Operational Plan (EROP) for the Solid Waste Disposal Facility (Platte River 1980), and in the Final Report Investigation of the Groundwater Monitoring Program for the Bottom Ash Disposal Site conducted by Lidstone and Anderson Inc. (1989). According to the 1980 EROP, hydrogeology of the Rawhide Station was originally investigated by drilling and installing 23 piezometers in conjunction with the original geotechnical investigation of the Site prior to construction of the facility. Data from the piezometers indicated that a groundwater table exists within the weathered and fractured Pierre Shale bedrock beneath the Site, and in alluvial deposits along Coal Creek. The report indicated that the depth to groundwater varied across the Site from 11 to 67 feet below ground surface (bgs), with groundwater generally flowing to the south-southeast. The shallow water table, as explained in the 1980 EROP, was reported to be directly recharged by infiltration from precipitation and surface runoff.

Following construction and operation of the Rawhide Station, Lidstone and Anderson (1989) concluded that sufficient groundwater data were collected to determine a mound had formed in the shallow, weathered, and fractured Pierre Shale in the vicinity of Hamilton Reservoir. After a review of available groundwater level information for Rawhide Station, AECOM concluded that the CCR units present at the Site are located hydraulically upgradient of any groundwater mound created by Hamilton Reservoir.

### 2.4 Ash Monofill Hydrogeology

The Ash Monofill is constructed within a narrow south-sloping valley with bedrock highs along both sides. The uppermost water-bearing stratum at the Ash Monofill was identified during groundwater monitoring well installation as the weathered and fractured Pierre Shale. Groundwater at the Ash Monofill is under water table conditions and, in 2023, was present at depths from approximately 20 to 34 feet bgs in piezometers PZ-3 through PZ-5, located within the footprint of Cell 2. Groundwater flow is generally from northwest to southeast, from the Ash Monofill towards Hamilton Reservoir, generally following the topographic slope of the valley.

### 3.0 Groundwater Monitoring Activities in 2023

This section summarizes groundwater monitoring activities conducted in 2023 to comply with the CCR Rule. Groundwater monitoring activities included:

- Measuring groundwater levels at each monitoring well prior to purging and sampling to provide potentiometric data;
- Groundwater sampling and analysis of Appendix III and Appendix IV constituents to identify potential releases from the Ash Monofill and to collect supplemental data to update the background statistics. Two semi-annual Assessment monitoring sampling events were conducted in April and October 2023; and
- Statistical analysis of the 2023 Appendix III and Appendix IV data to determine if there were any SSIs over background and whether any of the SSIs were above GWPS at an SSL.

#### 3.1 Water Level Measurements

During each monitoring event, groundwater levels were measured at Ash Monofill network monitoring wells using an electronic water level meter. **Table 1** presents monitoring well survey locations and well construction details including surveyed top of casing results. Groundwater level measurements were recorded to the nearest hundredth (0.01) of a foot. The water level meter cable and sensor were decontaminated at the start of field activities and after use at each well to limit the potential for cross-contamination between wells. Water level measurements were recorded on groundwater sampling forms, provided in **Appendix A**, and are tabulated in **Table 2** for the April and October 2023 monitoring events.

#### 3.2 Groundwater Sample Collection

Two rounds of semi-annual Appendix III and Appendix IV groundwater samples were collected at the Ash Monofill wells (ASH-01, ASH-02, ASH-03, ASH-04, ASH-05, ASH-06, ASH-07, and ASH-08) on April 24 to April 27, 2023, and October 10 to October 12, 2023.

Groundwater samples were collected in general accordance with the CCR Ash Monofill Groundwater Detection Monitoring Plan (AECOM 2017). Each well was initially purged using a submersible bladder pump and dedicated polyethylene bonded tubing. Disposable bladder liners were replaced before sampling each monitoring well and the pump casing was decontaminated prior to purging and sampling each monitoring well to avoid cross contamination between wells. The bladder pump and tubing were lowered into the well to a depth within the screen interval that was at least 1 to 2 feet off the bottom of the well to avoid disturbing accumulated sediment in the lower part of the well screen. Monitoring wells were purged using low flow sampling techniques until field parameter measurements of pH, temperature, dissolved oxygen, oxidation reduction potential, turbidity, and conductivity stabilized within  $\pm 10$  percent and water level drawdown was observed to be less than 0.33 feet between measurement readings. If the well did not stabilize, it was purged dry and sample collection was attempted after well recharge, but within 24 hours of purging. . Purge water volumes were recorded on groundwater sampling forms (**Appendix A**).

After purging, the samples were collected from the discharge tube of the bladder pump directly into laboratory-supplied sample containers. Sample water was slowly pumped into each laboratory sample container until the containers were appropriately filled, taking care not to spill the laboratory preservative contained in sample bottles. The sample containers were then labeled and placed on ice in a sample cooler. At the conclusion of the field day, the samples were shipped by overnight carrier to Pace Analytical in Lenexa, Kansas and Greensburg, Pennsylvania, for analysis.

### 3.3 Analytical Program

Groundwater samples collected from the Ash Monofill wells were analyzed using U.S. Environmental Protection Agency (USEPA) SW-846 methods for Appendix III and Appendix IV constituents. All analytical results are reported as totals (unfiltered). **Table 3** summarizes the groundwater analytical results for 2023 for each sampling event. The laboratory analytical reports are provided in **Appendix B**.

**Appendix III constituents include:**

| Chemical Name | Analytical Method  |
|---------------|--|
| Boron         | 6010C  |
| Chloride      | 9056A  |
| Calcium       | 6010C  |
| Fluoride      | 9056A  |
| pH            | Field measurement  |
| Sulfate       | 9056A  |
| TDS           | TDS (American Public Health Association et al. [1998] Standard Method 2540C) |

TDS = total dissolved solids.

**Appendix IV constituents include:**

| Chemical Name                | Analytical Method |
|------------------------------|-------------------|
| Antimony                     | 6020A             |
| Arsenic                      | 6020A             |
| Barium                       | 6020A             |
| Beryllium                    | 6020A             |
| Cadmium                      | 6020A             |
| Chromium                     | 6020A             |
| Cobalt                       | 6020A             |
| Fluoride                     | 9056A             |
| Lead                         | 6020A             |
| Lithium                      | 6010C             |
| Mercury                      | 7470A             |
| Molybdenum                   | 6020A             |
| Selenium                     | 6020A             |
| Thallium                     | 6020A             |
| Radium 226 and 228, combined | 9315/9320         |

### 3.4 Quality Control/Quality Assurance

Quality assurance and quality control samples collected during sampling activities included one field duplicate for each round of Assessment monitoring, one equipment rinse blank, and one matrix spike/matrix spike duplicate sample. The field duplicate samples were collected immediately following

collection of the primary samples using the same sampling procedures. The equipment rinse blank samples were collected after decontaminating the bladder pump casing or water level meter using procedures outlined in the Groundwater Monitoring Plan (AECOM 2017).

### **3.5 Data Validation**

The laboratory data were validated by AECOM chemists using USEPA guidance. Data validation reports are provided in **Appendix B**.

## 4.0 Monitoring Results and Evaluation

This section discusses potentiometric surface elevations, groundwater flow directions, and analytical sampling results for the samples collected during the two Assessment monitoring events conducted in April and October 2023 at the Ash Monofill.

### 4.1 Groundwater Potentiometric Surface

The groundwater elevations were used to prepare potentiometric surface maps for April and October sampling events (**Figure 2** and **Figure 3**). These maps were used to determine if groundwater in the uppermost aquifer beneath the Ash Monofill flows from northwest to southeast at an average hydraulic gradient of 0.0143 feet per foot (ft/ft) between monitoring wells ASH-01 and ASH-02 in 2023. This is similar to the gradient of 0.0142 ft/ft between ASH-01 and ASH-02 calculated in 2022 and is consistent with the average gradients previously reported in past annual reports (AECOM 2018a, 2019, 2020, 2021, 2022, and 2023).

### 4.2 Groundwater Flow Rate

An average flow rate was calculated for groundwater in the uppermost aquifer beneath the Ash Monofill using the minimum (0.085 foot per day (ft/day)); maximum (1.44 ft/day); and geometric mean (0.935 [ft/day) hydraulic conductivities determined from slug tests, the average hydraulic gradient (0.0143 ft/ft) determined between monitoring wells ASH-01 and ASH-02, and an assumed effective porosity of 15 percent for fractured Pierre Shale. The results indicate that groundwater in the uppermost aquifer beneath the Ash Monofill flows at a rate ranging from approximately  $8.123\text{E-}3$  to  $1.376\text{E-}1$  ft/day, with a geometric mean of  $8.935\text{E-}2$  ft/day. The groundwater velocity calculation sheet is attached in **Appendix C**.

### 4.3 Groundwater Analytical Results

Groundwater samples were collected and analyzed for Appendix III and IV parameters specified in Section 3.3 in April and October 2023. The samples were analyzed by Pace Analytical in Lenexa, Kansas and Greensburg, Pennsylvania. The laboratory analytical reports are provided in **Appendix B** and included in the facility operating record. The laboratory results were reviewed for completeness against the project-required analytical methods and the chain-of-custody forms and subsequently validated by AECOM. The data were found to be valid and useable with qualification as outlined in the data validation reports provided in **Appendix B**. **Table 3** summarizes the groundwater analytical results for each sampling round. Monitoring wells ASH-01, ASH-02, ASH-03, ASH-04, ASH-05, ASH-06, ASH-07, and ASH-08 were sampled during the 2023 events to comply with Assessment monitoring requirements.

### 4.4 Groundwater Monitoring System Evaluation

All monitoring wells comprising the Ash Monofill groundwater monitoring network were inspected during each sampling round and were found to be in good condition and capable of supplying a representative sample. However, historically wells within the ash groundwater monitoring network have had increased turbidity due to the fine-grained composition of the Pierre Shale and may require further well development into the future if turbidity levels return to elevated levels. Ash monofill network wells in 2023 did not show elevated turbidity measurements.

Analysis of potentiometric surface maps constructed using the depth to groundwater measurements obtained during each sampling round confirm that monitoring wells ASH-01 and ASH-06 are located upgradient of the Ash Monofill and represent background groundwater quality, and that monitoring wells ASH-02, ASH-03, ASH-04, ASH-05, ASH-07, and ASH-08 are located downgradient of the Ash Monofill and represent downgradient groundwater quality.

**4.5 Problems Encountered and Actions Taken**

There were no problems encountered or actions taken during 2023.

## 5.0 Statistical Analysis Results

The Ash Monofill groundwater quality data were evaluated using the certified statistical approach presented in the CCR Ash Monofill Groundwater Detection Monitoring Plan (AECOM 2017). Groundwater quality data were evaluated using an interwell approach that statistically compared constituent concentrations at downgradient monitoring wells to those present at background monitoring wells. For the Ash Monofill, monitoring wells ASH-01 and ASH-06 are designated as the background wells because they are located upgradient of the northern landfill boundary, whereas monitoring wells ASH-02, ASH-03, ASH-04, ASH-05, ASH-07, and ASH-08 are designated as compliance wells because they are located downgradient of the southern monofill boundary.

The statistical analyses were performed in accordance with 40 CFR Parts 257.93(f), 257.93(g), and 257.93(h) and the Statistical Method Certification (AECOM 2017). Using ProUCL Version 5.1, prediction limits (i.e., parametric or nonparametric) with one of retesting were developed for each constituent based on the frequency of non-detect values and whether the background data for that constituent exhibited a normal, lognormal, or nonparametric distribution. For the statistical analysis, non-detect values were represented as one-half the detection limit. No outliers were identified in the data. Analytical data from the background monitoring wells collected between March 2016 and October 2021 were used to develop an upper prediction limit (UPL) for the background data at 95 percent confidence. Data from the downgradient monitoring wells for the reporting period were compared to the UPL to identify SSIs over background. The results of the statistical analyses, including the Appendix III and IV UPLs, are provided in **Table 4** and **Table 5**, respectively. The ProUCL statistical analysis input files and output files are provided in **Appendix D**.

### 5.1 Appendix III SSI Determination

The Appendix III results were compared against their respective background UPLs to determine if they exhibited SSIs above background. This comparison indicates that some of the boron, calcium, chloride, sulfate, and TDS concentrations at monitoring wells ASH-02, ASH-03, ASH-04, ASH-05, ASH-07, and ASH-08 have verified SSIs above the background UPLs as shown in the table below. Fluoride and pH did not show any SSIs above background at any of the downgradient compliance wells. The Appendix III SSIs found during 2023 are consistent with those identified during 2022 and prior years. Specific events where exceedances were observed, and analytical concentrations of detections can be found in **Table 3**.

| Well   | Boron | Calcium | Chloride | Fluoride | pH    | Sulfate | TDS   |
|--------|-------|---------|----------|----------|-------|---------|-------|
| ASH-02 | SSI   | -----   | -----    | -----    | ----- | -----   | ----- |
| ASH-03 | SSI   | SSI     | SSI      | -----    | ----- | SSI     | SSI   |
| ASH-04 | SSI   | SSI     | SSI      | -----    | ----- | SSI     | SSI   |
| ASH-05 | SSI   | SSI     | SSI      | -----    | ----- | SSI     | SSI   |
| ASH-07 | SSI   | SSI     | SSI      | -----    | ----- | SSI     | SSI   |
| ASH-08 | SSI   | SSI     | SSI      | -----    | ----- | SSI     | SSI   |

**Notes:**

 = concentration below UPL.

 = statistically significant increase (Indicating concentrations above the background UPL).

### 5.2 Appendix IV SSI Determination

The Appendix IV Assessment monitoring results were compared against their respective background UPLs to determine if they exhibited SSIs above background. This comparison indicates that selenium at monitoring wells ASH-03, ASH-04, and ASH-07 exhibit verified SSIs over the background UPL as shown

in the table below. No other Appendix IV constituents exhibited verified SSIs over background. SSLs were calculated for select constituents and are described in Section 5.4 below.

| Well   | Sb   | As   | Ba   | Be   | Cd   | Cr   | Co   | F    | Pb   | Li   | Hg   | Mo   | Ra   | Se   | Th   |
|--------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| ASH-02 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| ASH-03 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | SSI  | ---- |
| ASH-04 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | SSI  | ---- |
| ASH-05 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| ASH-07 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | SSI  | ---- |
| ASH-08 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |

**Notes:**

---- = concentration below UPL.

SSI = statistically significant increase (Indicating concentrations above the background UPL).

### 5.3 Establishment of Groundwater Protection Standards

GWPS were selected for the detected Ash Monofill Appendix IV constituents using the criteria specified in 40 CFR 257.95(h). The GWPSs listed on **Tables 3, 4, 5** were selected from the USEPA drinking water maximum contaminant limits, groundwater standards provided in 40 CFR 257.95(h)(2), or the background UPLs where they exceeded either of the other standards.

### 5.4 Appendix IV SSL Determination

Constituents exhibiting an SSI over the background UPL for two consecutive events were further evaluated to determine whether they are present at SSLs relative to GWPS established under the CCR Rule (40 CFR 257.95(d)(2)). SSLs were identified by calculating the 95 percent lower confidence limit (95% LCL) at each well where the Assessment monitoring constituents exhibited a verified SSI over background and comparing the 95% LCL to the GWPS. A constituent is present at an SSL over the GWPS if the 95% LCL is greater than the GWPS. Selenium concentrations at monitoring wells ASH-03, ASH-04, and ASH-07 were found at an SSL above the GWPS because their 95% LCLs were greater than the selenium GWPS (0.05 milligram per liter [mg/L]) as shown in the table below. Appendix IV constituents that exceed the GWPS at an SSL require an alternate source demonstration or corrective action. Selenium is the only Appendix IV constituent requiring corrective action at this time.

| Well   | Sb   | As   | Ba   | Be   | Cd   | Cr   | Co   | F    | Pb   | Li   | Hg   | Mo   | Ra   | Se   | Th   |
|--------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| ASH-02 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| ASH-03 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | SSL  | ---- |
| ASH-04 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | SSL  | ---- |
| ASH-05 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |
| ASH-07 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | SSL  | ---- |
| ASH-08 | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- | ---- |

**Notes:**

---- = concentration below UPL.

SSL = statistically significant level (indicating 95% LCL exceeded GWPS).

| Well No. | Parameter | 95% LCL<br>(mg/L) | GWPS<br>(mg/L) |
|----------|-----------|-------------------|----------------|
| ASH-03   | Selenium  | 0.08845           | 0.05           |
| ASH-04   | Selenium  | 0.07333           | 0.05           |
| ASH-07   | Selenium  | 0.11380           | 0.05           |

**Notes:**

 constituent's 95% LCL exceeds the GWPS.

GWPS = groundwater protection standard.

95% LCL = 95 percent lower confidence limit.

mg/L = milligrams per liter.

## 6.0 Projected Activities in 2024

The following activities are anticipated to be performed at the Ash Monofill during calendar year 2024:

- Platte River will continue groundwater monitoring at the Ash Monofill on a semiannual basis for the Appendix III constituents and Appendix IV constituents that were detected as specified in 40 CFR 257.95(d)(1) or 40 CFR 257.95(f). The full list of Appendix IV constituents also will be sampled annually.
- Platte River completed construction of a new engineered landfill cell (referred to as Cell 2B) for ash management in April 2023 (AECOM 2024). Cell 2B has an engineered leachate system and improved storm water diversion features that may influence groundwater flow within the footprint and downgradient of the landfill. Groundwater monitoring data from 2023 onwards will be evaluated for potential influence Cell 2B may have on groundwater flow and constituent concentrations.
- An assessment of corrective measure (ACM) was prepared in August 2019 to identify potential remedial alternatives for selenium in groundwater at the Ash Monofill. The ACM included a range of cleanup options that included monitored natural attenuation, groundwater pump and treat, and a permeable reactive barrier. The ACM options were presented at a public meeting in November 2019. In 2024, the corrective action options presented in the ACM will be evaluated for a final remedy selection and implementation. Remedy selection will be based on adequate monitoring data, the site hydrogeology, contaminant migration pathways and contaminant exposure pathways. The evaluation will also consider any influence the newly engineered landfill Cell 2B may have on groundwater flow and constituent concentrations.

## 7.0 Summary and Findings

AECOM, on behalf of Platte River, oversaw groundwater sampling and analysis of Detection (Appendix III) and Assessment (Appendix IV) monitoring at the Ash Monofill. Monitoring data and analytical results collected as part of the semi-annual Detection and Assessment monitoring programs were evaluated to determine potentiometric surface elevations, groundwater flow directions and rates, and whether any constituents were present at an SSI above background UPLs or exceeded GWPS at an SSL. The existing Ash Monofill monitoring well network was not modified this year as no new monitoring wells were installed as part of the Assessment monitoring program.

The Appendix III detection monitoring results indicate that some of the boron, calcium, chloride, sulfate, and TDS concentrations at monitoring wells ASH-02, ASH-03, ASH-04, ASH-05, ASH-07, and ASH-08 represent verified SSIs above the background UPLs. Selenium concentrations in groundwater at monitoring wells ASH-03, ASH-04, ASH-07 were found to represent verified SSIs above background UPLs. Additional statistical analysis found that selenium exceeds the GWPS at an SSL at wells ASH-03, ASH-04, and ASH-07. These results require continued Assessment monitoring and corrective action for selenium at the Ash Monofill.

An ACM was prepared in August 2019 to identify potential remedial alternatives for selenium in groundwater at the Ash Monofill. The ACM included a range of cleanup options that included monitored natural attenuation, groundwater pump and treat, and a permeable reactive barrier. The ACM options were presented at a public meeting in November 2019. In 2024, the corrective action options presented in the ACM will be evaluated for a final remedy selection and implementation. The evaluation will also consider any influence the newly engineered landfill Cell 2B may have on groundwater flow and constituent concentrations.

**Notes:**

N = primary sample

R = unusable, non-detect data analyzed outside of required holding time

FD = field duplicate

mg/L = milligrams per liter

ug/L = micrograms per liter

pCi/L = picoCuries per liter

Bold black value is detected result

Bold red value exceeds groundwater protection standard (GWPS)

SSI = statistically significant increase over background upper prediction limit (UPL)

SSL = statistically significant level above the GWPS

J = estimated concentration (+ = biased high, - = biased low)

The GWPS represents the maximum contaminant limits (MCLs) outlined by 40 CFR 257.95 (h), unless the background UPL exceeds the MCL, in which case the GWPS will be represented by the UPL. For GWPSs represented by the UPL, the MCL is presented next to it in parentheses.

**Notes:**

N = primary sample

R = unusable, non-detect data analyzed outside of required holding time

FD = field duplicate

mg/L = milligrams per liter

ug/L = micrograms per liter

pCi/L = picoCuries per liter

Bold **black** value is detected resultBold **red** value exceeds groundwater protection standard (GWPS)

SSI = statistically significant increase over background upper prediction limit (UPL)

SSL = statistically significant level above the GWPS

J = estimated concentration (+ = biased high, - = biased low)

The GWPS represents the maximum contaminant limits (MCLs) outlined by 40 CFR 257.95 (h), unless the background UPL exceeds the MCL, in which case the GWPS will be represented by the UPL. For GWPSs represented by the UPL, the MCL is presented next to it in parentheses.

**Table 4**  
**Ash Monofill Appendix III Background Upper Prediction Limits**  
**PRPA Ash Monofill Annual Report for 2023**  
**PRPA Rawhide Facility, Colorado**

| Parameter (Units)             | Number of Samples | Percent Non-detects | Normal or Lognormal Distribution? | Statistical Test | Background UPL |

**Notes:**

GWPS = groundwater protection standard

mg/L = milligrams per liter

pCi/L = picoCuries per liter

MDL = background limit set at maximum detection or reporting limit

Upper Prediction limits calculated using data from September 2016 through October 2021

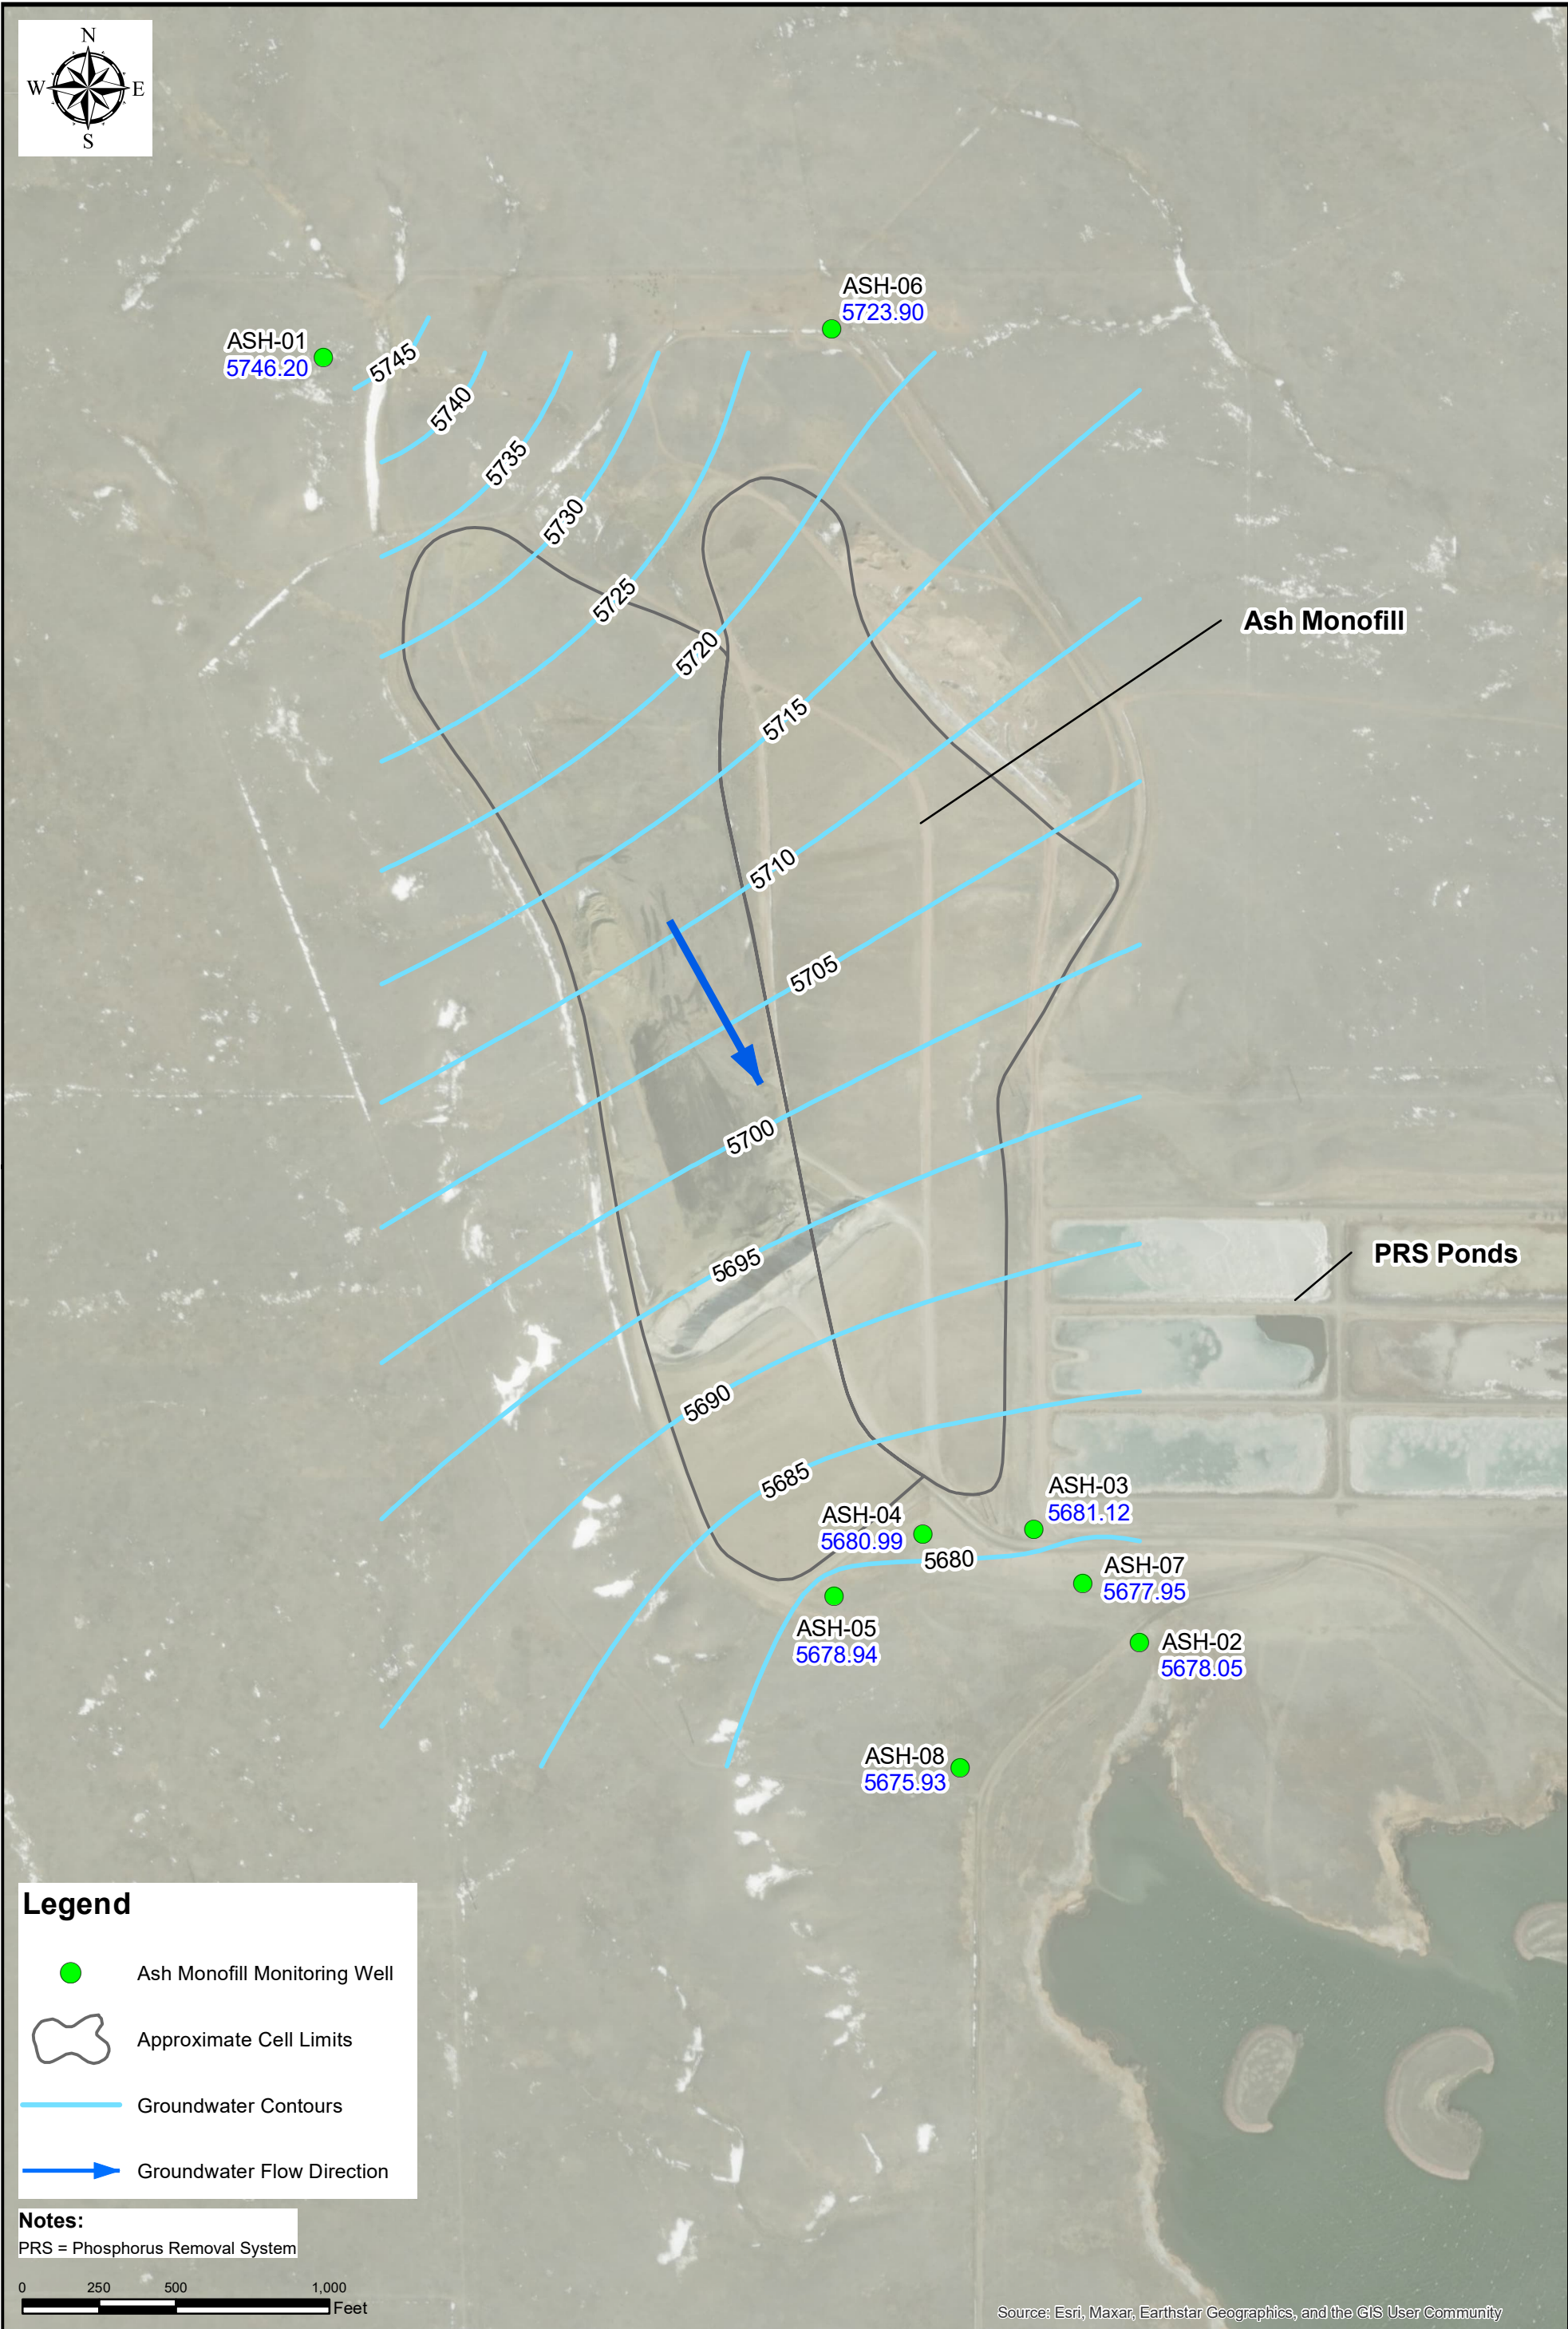

All of the antimony, beryllium, cadmium, chromium, cobalt, mercury, molybdenum, and thallium results in the background monitoring wells were reported as not detected or detected less than 5 percent. For these constituents, the maximum detection or reporting limit was selected as the UPL per the double quantification rule in the U.S. Environmental Protection Agency's Unified Statistical Guidance (2009).

The GWPS represents the maximum contaminant limits (MCLs) outlined by 40 CFR 257.95 (h), unless the background UPL exceeds the MCL, in which case the GWPS will be represented by the UPL. For GWPSs represented by the UPL, the MCL is presented below it in parentheses.

Sample Type: -- -- Not analyzed for this parameter  
FD – Field Duplicate  
X<sup>m</sup> – Matrix Spike/Matrix Spike Duplicate

EB – Equipment Blank  
N – Normal Sample  
X<sup>ml</sup> – Matrix/Matrix Spike Duplicate – Select Methods

Analyses: General Chemistry – Anions: chloride, fluoride, sulfate (Method 9056), and total dissolved solids (TDS) (SM 2540C).  
Total Metals – Boron, calcium, lithium (6010), antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, molybdenum, selenium, thallium (6020), mercury (7470A)  
Total Radium\* – Includes radium-226 (Method 903.1), radium-228 (Method 904.0), and total radium combined (TRC)

This report contains the final results of the data validation conducted for water samples collected April 2023 for the Platte River Power Authority – Rawhide CCR sampling event. The sample results were presented in ten data packages. The data validation review was conducted in accordance with *National Functional Guidelines for Inorganic Superfund Methods Data Review* (EPA November 2020), and evaluation of laboratory criteria, as applicable.

#### General Overall Assessment:

- \_\_\_\_\_ Data are usable without qualification.  
  X   Data are usable with qualification (noted below, summarized in Attachment A).  
 \_\_\_\_\_ Some or all data are unusable for any purpose (noted below, summarized in Attachment A).

#### Case Narrative Comments:

Any case narrative comments concerning data qualification were addressed as noted in the table below.

| Review Parameter                  | Criteria Met? | Comments  |
|-----------------------------------|---------------|---|
| Chain of Custody & Sample Receipt | Yes           | <p>With the exceptions noted below, the samples were received by Pace Analytical Services, LLC in Lenexa, Kansas and Greensburg, Pennsylvania in good condition and were consistent with the accompanying chain of custody (COC). The cooler temperatures upon receipt were within the recommended <math>\leq 6</math> degrees Celsius (<math>^{\circ}\text{C}</math>) temperature range.</p> <p><b>Data Package 60427315</b></p> <p>The sample collection time for sample DUP-01-CCR was not documented on the COC. The sample is a blind field duplicate, and the parent sample and collection time are documented on the applicable field forms. As no collection time was documented on the COC, and as the collection time is required for sample login, it is standard laboratory practice to log the sample with a collection time of midnight (00:00). No further action was required, and qualification was not considered necessary.</p> <p><b>Data Package 60427378</b></p> <p>During review of the data package, it was noted that the cooler temperature upon receipt was not provided. However, due to the stability of the radiological parameters, data qualification on the basis of temperature exceedance is not considered necessary, and no further action is required.</p> <p>The sample collection time for sample DUP-01-CCR was not documented on the COC. . The sample is a blind field duplicate, and the parent sample and collection time are documented on the applicable field forms. As no collection time was documented on the COC, and as the collection time is required for sample login, it is standard laboratory practice to log the sample with a collection time of midnight (00:00). No further action was required, and qualification was not considered necessary.</p> <p><b>Data Package 60427409</b></p> <p>During review of the data package, it was noted that the cooler temperature upon receipt was not provided. | Review Parameter  | Criteria Met? | Comments  |
|---|---------------|---|
|   |               | basis of temperature exceedance is not considered necessary, and no further action is required.   |
| Holding Times   | Yes           | The analyses were conducted within the method required holding time.  |
| Laboratory Blanks <ul style="list-style-type: none"> <li>Method Blank (MB)</li> </ul>   | No            | With the exception listed in Table 1, the target analytes were not detected within the method blanks or the associated radium concentrations were reported at concentrations less than the minimum detectable concentration (MDC).  |
| Matrix Quality Control <ul style="list-style-type: none"> <li>Matrix Spike/ Matrix Spike Duplicate<br/><b>Data Packages 60427323</b><br/>ASH-08-CCR (Total metals, anions)</li> <li><b>Data Package 60427409</b><br/>ASH-08-CCR (Radium 226, Radium 228)</li> <li>Laboratory Duplicate<br/><b>Data Package 60427323</b><br/>ASH-08-CCR (TDS, anions)</li> </ul> | No            | <p><b>Matrix Spike/ Matrix Spike Duplicate (MS/MSD)</b></p> <p>With the exceptions listed in Table 2, the MS/MSD recoveries and relative percent differences (RPDs) met quality control criteria.</p> <p>Results in the native sample greater than four times the concentration of the spike added during digestions/extractions are not considered to be a representative measure of accuracy. Further action with respect to spike recovery evaluation or qualification of data was not considered necessary.</p> <p><b>Laboratory Duplicate</b></p> <p>The laboratory duplicate samples were within the laboratory determined acceptance limits. The following concentration dependent criteria were used to evaluate laboratory duplicates:</p> <ul style="list-style-type: none"> <li>When both the sample and duplicate values are &gt;5x the reporting limit (RL), acceptable sampling and analytical precision is indicated by an relative percent difference (RPD) between the results of <math>\leq 20\%</math>.</li> <li>Where the result for one or both analytes of the method duplicate pair is <math>&lt; 5 \times \text{RL}</math>, satisfactory precision is indicated if the absolute difference between the method duplicate results is <math>&lt; 1 \times \text{RL}</math>.</li> </ul> |
| Laboratory Performance <ul style="list-style-type: none"> <li>Laboratory Control Sample</li> </ul>  | Yes           | There was one laboratory control sample (LCS) and/or laboratory control sample duplicate (LCSD) per method per analytical method, prepared and analyzed, except for radium 226, radium 228, and total radium. The available LCS recoveries and LCS/LCSD RPDs were within the laboratory acceptance limits. These results are indicative of an acceptable level of accuracy and precision with respect to the analytical method.   |
| Field Quality Control <ul style="list-style-type: none"> <li>Field Blank<br/>None</li> <li>Equipment Blank<br/><b>Data Packages 60427179/ 60427378</b><br/>ERB-02-CCR</li> <li>Field Duplicate<br/><b>Data Packages 60427315/ 60427378</b><br/>ASH-02-CCR/ DUP-01-CCR</li> </ul>  | No            | <p><b>Field Blank</b></p> <p>A field blank was not submitted with the samples associated with this sampling event.</p> <p><b>Equipment Blank</b></p> <p>The target analytes were not detected within the equipment blank or the associated radium concentrations were reported at concentrations less than the MDC.</p> <p><b>Field Duplicate</b></p> <p>The field duplicate sample results satisfied the evaluation criteria below:</p>  |

| Review Parameter               | Criteria Met? | Comments  |
|--------------------------------|---------------|---|
|                                |               | <ul style="list-style-type: none"> <li>When both the sample and duplicate values are &gt;5xRL acceptable sampling and analytical precision is indicated by a RPD between the results of <math>\leq 30\%</math>.</li> <li>Where the result for one or both analytes of the field duplicate pair is &lt;5xRL, satisfactory precision is indicated if the absolute difference between the field duplicate results is &lt;2xRL.</li> <li>For radiological parameters, the agreement between parent sample results and field duplicate sample results were evaluated. The duplicate error ratio (DER) met the criterion of a DER <math>\leq 2</math>.</li> </ul> |
| Tracer and/or Carrier Recovery | Yes           | The sample specific recoveries were within the laboratory limits (30-110%).   |
| Reporting Limits               | No            | <p>For non-radiological parameters, several analytes were reported as non-detect at elevated reporting limits. These non-detect results will need to be evaluated by the end user of the data with respect to project objectives.</p> <p>With the exceptions listed in Table 3, for radiological parameters, if the associated uncertainty was greater than the reported result, the 2 sigma (<math>\sigma</math>) uncertainty multiplied by 1.65 was less than or equal to the specified detection limit.</p>  |
| Package Completeness           | Yes           | The results are usable as qualified for the project objective. The data are considered 100% complete.   |

°C – Degrees Celsius  
 % – Percent  
 ≥ – Greater Than or Equal To  
 ≤ – Less Than or Equal To  
 > – Greater Than  
 < – Less Than  
 ± – Plus or Minus  
 $\sigma$  – Sigma  
 COC – Chain of Custody  
 DER – Duplicate Error Ratio

ID – Identification  
 LCS – Laboratory Control Sample  
 LCSD – Laboratory Control Sample Duplicate  
 MDC – Minimum Detectable Concentration  
 MDL – Method Detection Limit  
 MS – Matrix Spike  
 MSD – Matrix Spike Duplicate  
 RL – Reporting Limit  
 RPDs – Relative Percent Differences  
 VOCs – Volatile Organic Compounds

| Laboratory Blank/<br>Associated Samples | Analyte | Concentration | Qualification |
|---|---------|---------------|---------------|
| Data Package 60427378                   |         |               |               |

**Table 1: Laboratory Blank Outliers and Resultant Data Qualification**

| Laboratory Blank/<br>Associated Samples   | Analyte    | Concentration       | Qualification  |
|---|------------|---------------------|--|
| <b>MB 2843569</b><br>ASH-01-CCR<br>ASH-02-CCR<br>DUP-01-CCR<br>ERB-02-CCR<br>ASH-06-CCR | Radium 226 | 0.508 ± 0.332 pCi/L | None. The associated sample results were reported at concentrations less than the MDC; therefore, qualification was not considered necessary.  |
|   | Radium 228 | 0.424 ± 0.314 pCi/L | The associated result for sample ASH-01-CCR was reported at a concentration greater than the MDC and <10x the concentration of the blank contamination and was qualified as estimated (J+ bl) to reflect the high bias indicated by the blank contamination. |

± – Plus or Minus

&lt; – Less than

bl – Laboratory Blank Contamination

J+ – Estimated, High Bias

MB – Method Blank

MDC – Minimum Detectable Concentration

pCi/L – Picocuries per Liter

x – Times

**Table 2: MS/MSD Recovery and RPD Outliers and Resultant Data Qualification**

| Associated Samples           | Analyte  | %R<br>(Limits)           | RPD<br>(Limit) | Qualification   |
|------------------------------|----------|--------------------------|----------------|---|
| <b>Data Package 60427323</b> |          |                          |                |   |
| ASH-08-CCR                   | Fluoride | <b>70/73</b><br>(80-120) | 3<br>(15)      | As the potential bias was considered to be low, the associated sample result was qualified as estimated (UJ m). |

**Bold** – indicates a value that is outside of acceptance limits

%R – Percent Recoveries

ld – Laboratory Duplicate Imprecision

RPD – Relative Percent Difference

UJ – Estimated, Non-Detect

**Table 3: Uncertainty Outliers and Resultant Data Qualification**

| Associated Samples    | Analyte    | Result (pCi/L) | 2 Sigma (σ) Uncertainty | MDC (pCi/L) | Qualification  |
|-----------------------|------------|----------------|-------------------------|-------------|--|
| Data Package 60427378 |            |                |                         |             |  |
| ASH-02-CCR            | Radium 226 | 0.133          | ± 0.304                 | 0.489       | As the 2σ uncertainty multiplied by 1.65 was greater than the reported minimum detectable concentration (MDC), the associated results were qualified as estimated (J v). |
| DUP-01-CCR            |            | 0.296          | ± 0.387                 | 0.638       |  |
| Data Package 60427409 |            |                |                         |             |  |

RE: Project: 60709371 PRPA CCR  
Pace Project No.: 60427179

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on April 26, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Kansas City

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson

## QUALIFIERS

Project: 60709371 PRPA CCR

Pace Project No.: 60427179

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

### ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

R1 RPD value was outside control limits.

Sample Type: -- – Not analyzed for this parameter

EB – Equipment Blank

FD – Field Duplicate

N – Normal Sample

Analyses:

General Chemistry – Anions: chloride, fluoride, sulfate (Method 9056), and total dissolved solids (TDS) (SM 2540C).

Total Metals – Boron, calcium, lithium (6010), antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, molybdenum, selenium, thallium (6020), mercury (7470A)

Total Radium\* – Includes radium-226 (Method 903.1), radium-228 (Method 904.0), and total radium combined (TRC)

This report contains the final results of the data validation conducted for water samples collected October 2023 for the Platte River Power Authority – Rawhide CCR sampling event. The sample results were presented in five data packages. The data validation review was conducted in accordance with *National Functional Guidelines for Inorganic Superfund Methods Data Review* (EPA November 2020), and evaluation of laboratory criteria, as applicable.

#### General Overall Assessment:

- \_\_\_\_\_ Data are usable without qualification.
- X   Data are usable with qualification (noted below, summarized in Attachment A).
- \_\_\_\_\_ Some or all data are unusable for any purpose (noted below, summarized in Attachment A).

#### Case Narrative Comments:

Any case narrative comments concerning data qualification were addressed as noted in the table below.

| Review Parameter  | Criteria Met? | Comments  |
|---|---------------|---|
| Chain of Custody & Sample Receipt   | No            | <p>With the exceptions noted below, the samples were received by Pace Analytical Services, LLC in Lenexa, Kansas and Greensburg, Pennsylvania in good condition and were consistent with the accompanying chain of custody (COC). The cooler temperatures upon receipt were within the recommended <math>\leq 6</math> degrees Celsius (<math>^{\circ}\text{C}</math>) temperature range as applicable to the method.</p> <p><b>Data Packages 60439539 and 60439823</b></p> <p>The sample collection time for sample DUP-01-CCR was not documented on the COC. As the sample was submitted as a blind duplicate, the time was omitted by the field sampling team to preserve anonymity of the sample. Further action was not considered necessary.</p> <p>The laboratory revised and reissued the data packages to exclude sample ASH-09-CCR as this sample was collected in error. The sample was not evaluated and is not included in this validation report.</p> |
| Holding Times   | Yes           | The analyses were conducted within the method required holding time.  |
| Laboratory Blanks <ul style="list-style-type: none"> <li>Method Blank (MB)</li> </ul>                                       | No            | <p>With the exception listed in Table 1 and comment below, the target analytes were not detected within the method blanks or the associated radium concentrations were reported at concentrations less than the minimum detectable concentration (MDC).</p> <p><b>Data Package 60439823</b></p> <p><b>Method SM2540C</b></p> <p>The laboratory noted total dissolved solids was detected in the instrument blank associated with samples ASH-03-CCR, ASH-08-CCR, and DUP-01-CCR. The instrument blanks are not evaluated with this level of validation and were not provided by the laboratory; therefore, the data was qualified as estimated (J+ bl) to reflect the high bias indicated by the blank contamination.</p>   |
| Matrix Quality Control <ul style="list-style-type: none"> <li>Matrix Spike/ Matrix Spike Duplicate</li> <li>None</li> </ul> | NA            | <p><b>Matrix Spike/ Matrix Spike Duplicate (MS/MSD)</b></p> <p>A site-specific MS/MSD sample was not analyzed and reported for the associated data packages and could not be evaluated.</p>   |

| Review Parameter   | Criteria Met? | Comments  |
|--|---------------|---|
| <ul style="list-style-type: none"> <li>Laboratory Duplicate</li> </ul> None  |               | <b>Laboratory Duplicate</b><br>A laboratory duplicate was not reported for the associated data packages.  |
| Laboratory Performance <ul style="list-style-type: none"> <li>Laboratory Control Sample</li> </ul>   | Yes           | There was one laboratory control sample (LCS) and/or laboratory control sample duplicate (LCSD) per method per analytical method, prepared and analyzed, with the exception of the calculated total radium result. The available LCS recoveries and LCS/LCSD RPDs were within the laboratory acceptance limits. These results are indicative of an acceptable level of accuracy and precision with respect to the analytical method.  |
| Field Quality Control <ul style="list-style-type: none"> <li>Field Blank</li> </ul> None <ul style="list-style-type: none"> <li>Equipment Blank</li> </ul> <b>Data Packages 60439820, 60440184</b><br>ERB-01-CCR <ul style="list-style-type: none"> <li>Field Duplicate</li> </ul> <b>Data Packages 60427315/ 60427378</b><br>ASH-03-CCR/ DUP-01-CCR | No            | <b>Field Blank</b><br>A field blank was not submitted with the samples associated with this sampling event.<br><b>Equipment Blank</b><br>With the exception listed in Table 2, the target analytes were not detected within the equipment blank or the associated radium concentrations were reported at concentrations less than the MDC.<br><b>Field Duplicate</b><br>The field duplicate sample results satisfied the evaluation criteria below: <ul style="list-style-type: none"> <li>When both the sample and duplicate values are &gt;5xRL acceptable sampling and analytical precision is indicated by a RPD between the results of <math>\leq 30\%</math>.</li> <li>Where the result for one or both analytes of the field duplicate pair is &lt;5xRL, satisfactory precision is indicated if the absolute difference between the field duplicate results is &lt;2xRL.</li> <li>For radiological parameters, the agreement between parent sample results and field duplicate sample results were evaluated. The duplicate error ratio (DER) met the criterion of a DER <math>\leq 2</math>.</li> </ul> |
| Tracer and/or Carrier Recovery   | Yes           | The sample specific recoveries were within the laboratory limits (30-110%).   |
| Reporting Limits   | No            | For non-radiological parameters, several analytes were reported as non-detect at elevated reporting limits. These non-detect results will need to be evaluated by the end user of the data with respect to project objectives.<br>With the exception listed in Table 3, for radiological parameters, if the associated uncertainty was greater than the reported result, then the 2 sigma ( $\sigma$ ) uncertainty multiplied by 1.65 was less than or equal to the specified detection limit.  |
| Package Completeness   | Yes           | The results are usable as qualified for the project objective. The data are considered 100% complete.   |

°C – Degrees Celsius

% – Percent

≥ – Greater Than or Equal To

≤ – Less Than or Equal To

> – Greater Than

< – Less Than

± – Plus or Minus

$\sigma$  – Sigma

COC – Chain of Custody

DER – Duplicate Error Ratio

ID – Identification

LCS – Laboratory Control Sample

LCSD – Laboratory Control Sample Duplicate  
MDC – Minimum Detectable Concentration  
MDL – Method Detection Limit  
MS – Matrix Spike

MSD – Matrix Spike Duplicate  
RL – Reporting Limit  
RPDs – Relative Percent Differences  
VOCs – Volatile Organic Compounds

**Table 1: Laboratory Blank Outliers and Resultant Data Qualification**

| Laboratory Blank/<br>Associated Samples   | Analyte    | Concentration       | Qualification   |
|---|------------|---------------------|---|
| <b>Data Package 60440184</b>  |            |                     |   |

RE: Project: 60709371 PRPA CCR  
Pace Project No.: 60439539

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on October 11, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson

## QUALIFIERS

Project: 60709371 PRPA CCR

Pace Project No.: 60439539

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).

Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

Email To: brian.rothmeyer@aecom.com  
Phone: (303) 740-2614 Fax:  
Requested Due Date/TAT: Standard

**Section B**  
Required Project Information:

Report To: Vasanta Kalluri  
Copy To: Brian Rothmeyer  
Purchase Order No.: 1599462  
Project Name: 60709371 PRPA CCR  
Project Number: 60709371

**Section C**  
Invoice Information:

Attention: Accounts Payable  
Company Name: AECOM  
Address: Same as Section A  
Pace Quote Reference: 42700  
Pace Project Manager: Heather Wilson  
Pace Profile #: 11033, 3

REGULATORY AGENCY  
☐ NPDES ☐ GROUND WATER ☐ DRINKING WATER

RE: Project: 60709371 PRPA CCR  
Pace Project No.: 60439820

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on October 12, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Kansas City

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson  
heather.wilson@pacelabs.com

## QUALIFIERS

Project: 60709371 PRPA CCR

Pace Project No.: 60439820

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

### ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

D6 The precision between the sample and sample duplicate exceeded laboratory control limits.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

R1 RPD value was outside control limits.

# CHAIN-OF-CUSTODY / Analytical Request Document

The Chain-of-Custody is a LEGAL DOCUMENT. All relevant fields must be completed accurately.

## Section A

Required Client Information:

Company: AECOM

Address: 6200 South Quebec St

Greenwood Village, CO 80111

Email To: brian.rothmeyer@aecom.com

Phone: (303) 740-2614

Fax:

Requested Due Date/TAT: Standard

## Section B

Required Project Information:

Report To: Vasantia Kalluri

Copy To: Brian Rothmeyer

Purchase Order No.: 1599462

Project Name: 60709371 PRPA CCR

Project Number: 60709371

## Section C

Invoice Information:

Attention: Accounts Payable

Company Name: AECOM

Address: Same as Section A

Pace Quote Reference: 42700

Pace Project Manager: Heather Wilson

Pace Profile #: 11033, 3

RE: Project: 60709371 PRPA CCR  
Pace Project No.: 60439823

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on October 12, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Kansas City

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson

## QUALIFIERS

Project: 60709371 PRPA CCR

Pace Project No.: 60439823

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

### ANALYTE QUALIFIERS

|    |   |
|----|---|
| 1e | Achieving a constant weight was not met with this sample.   |
| BH | Analyte was detected in an instrument blank. The result may be biased high.                                 |
| D3 | Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.  |
| D6 | The precision between the sample and sample duplicate exceeded laboratory control limits.                   |
| M1 | Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery. |
| R1 | RPD value was outside control limits.   |

RE: Project: 60709371 PRPA CCR  
Pace Project No.: 60439904

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on October 13, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Kansas City

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson

9608 Loiret Boulevard, Lenexa, KS 66219

Missouri Inorganic Drinking Water Certification #: 10090

Arkansas Drinking Water

Arkansas Certification #: 88-00679

Illinois Certification #: 2000302023-5

Iowa Certification #: 118

Kansas/NELAP Certification #: E-10116

Louisiana Certification #: 03055

Nevada Certification #: KS000212023-1

Oklahoma Certification #: 2022-057

Florida: Cert E871149 SEKS WET

Texas Certification #: T104704407-22-16

Utah Certification #: KS000212022-12

Illinois Certification #: 004592

Kansas Field Laboratory Accreditation: # E-92587

Missouri SEKS Micro Certification: 10070

## QUALIFIERS

Project: 60709371 PRPA CCR

Pace Project No.: 60439904

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

### ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

D6 The precision between the sample and sample duplicate exceeded laboratory control limits.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

R1 RPD value was outside control limits.

RE: Project: 60709371 PRPA CCR  
Pace Project No.: 60440184

Dear Vasanta Kalluri:

Enclosed are the analytical results for sample(s) received by the laboratory on October 13, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Heather Wilson

## QUALIFIERS

Project: 60709371 PRPA CCR

Pace Project No.: 60440184

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).

Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

## **Appendix C**

### **Groundwater Velocity Calculation Sheet**

Platte River Power Authority, Rawhide Station

Darcy

$V = Ki/n_e$

V = Velocity

K = Average Hydraulic Conductivity in ft/day

i = delta (height) / delta (length) (change in GW elevation / length of line drawn)

$n_e$  = Effective Porosity (15% for fractured Pierre shale)

Average Hydraulic Conductivity

| April ASH     |           | October ASH   |           |
|---------------|-----------|---------------|-----------|
| K =           | 0.935     | K =           | 0.935     |
| dH            | 68.15     | dH            | 70.89     |
| dL            | 4850      | dL            | 4850      |
| $n_e$         | 0.15      | $n_e$         | 0.15      |
| GW Velocity = | 8.759E-02 | GW Velocity = | 9.111E-02 |

Average 8.935E-02

Notes:

ASH wells gradient between ASH-01 and ASH-02 for dH and dL

| Gradient     | ASH-01 to ASH-02 |
|--------------|------------------|
| April 2023   | 0.014051546      |
| October 2023 | 0.014616495      |
| Average      | 0.014334021      |

Low Hydraulic Conductivity

| April ASH     |           | October ASH   |           |
|---------------|-----------|---------------|-----------|
| K =           | 0.085     | K =           | 0.085     |

| 78  |  |   | 95% UPL           |   | 607.5        |   |            | 90% Percentile |   | 526   |        |       |
| 79  |  |   | 90% Chebyshev UPL |   | 732.4        |   |            | 95% Percentile |   | 566   |        |       |
| 80  |  |   | 95% Chebyshev UPL |   | 871.9        |   |            | 99% Percentile |   | 616.5 |        |       |
| 81  |  |   | 95% USL           |   | 630          |   |            |                |   |       |        |       |
| 82  |  |   |                   |   |              |   |            |                |   |       |        |       |
| 83  | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20. |   |                   |   |              |   |            |                |   |       |        |       |
| 84  | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers    |   |                   |   |              |   |            |                |   |       |        |       |
| 85  | and consists of observations collected from clean unimpacted locations.  |   |                   |   |              |   |            |                |   |       |        |       |
| 86  | The use of USL tends to provide a balance between false positives and false negatives provided the data                  |   |                   |   |              |   |            |                |   |       |        |       |
| 87  | represents a background data set and when many onsite observations need to be compared with the BTV.                     |   |                   |   |              |   |            |                |   |       |        |       |
| 88  |  |   |                   |   |              |   |            |                |   |       |        |       |
| 89  | Calcium  |   |                   |   |              |   |            |                |   |       |        |       |

| 438 | Approx, f used to compute achieved CC  |   |   |   | 1.368  | Approximate Actual Confidence Coefficient achieved by UTL |   |   |   | 0.736  |   |   |
| 439 |  |   |   |   |        | Approximate Sample Size needed to achieve specified CC    |   |   |   | 59     |   |   |
| 440 | 95% Percentile Bootstrap UTL with 95% Coverage   |   |   |   | 9.63   | 95% BCA Bootstrap UTL with 95% Coverage                   |   |   |   | 9.63   |   |   |
| 441 | 95% UPL  |   |   |   | 9.497  | 90% Percentile  |   |   |   | 8.235  |   |   |
| 442 | 90% Chebyshev UPL  |   |   |   | 9.77   | 95% Percentile  |   |   |   | 9.008  |   |   |
| 443 | 95% Chebyshev UPL  |   |   |   | 10.76  | 99% Percentile  |   |   |   | 9.535  |   |   |
| 444 | 95% USL  |   |   |   | 9.63   |   |   |   |   |        |   |   |
| 445 |  |   |   |   |        |   |   |   |   |        |   |   |
| 446 | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20. |   |   |   |        |   |   |   |   |        |   |   |
| 447 | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers    |   |   |   |        |   |   |   |   |        |   |   |
| 448 | and consists of observations collected from clean unimpacted locations.  |   |   |   |        |   |   |   |   |        |   |   |
| 449 | The use of USL tends to provide a balance between false positives and false negatives provided the data                  |   |   |   |        |   |   |   |   |        |   |   |
| 450 | represents a background data set and when many onsite observations need to be compared with the BTV.                     |   |   |   |        |   |   |   |   |        |   |   |

| 568 |  |   |   |   |   |       |   |   |   |   |   |        |  |
| 569 | Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)                                  |   |   |   |   |       |   |   |   |   |   |        |  |
| 570 | Order of Statistic, r  |   |   |   |   | 26    | 95% UTL with95% Coverage                                  |   |   |   |   | 2520   |  |
| 571 | Approx, f used to compute achieved CC  |   |   |   |   | 1.368 | Approximate Actual Confidence Coefficient achieved by UTL |   |   |   |   | 0.736  |  |
| 572 | Approximate Sample Size needed to achieve specified CC   |   |   |   |   | 59    | 95% UPL   |   |   |   |   | 2408   |  |
| 573 | 95% USL  |   |   |   |   | 2520  | 95% KM Chebyshev UPL                                      |   |   |   |   | 5584   |  |
| 574 |  |   |   |   |   |       |   |   |   |   |   |        |  |
| 575 | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20. |   |   |   |   |       |   |   |   |   |   |        |  |
| 576 | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers    |   |   |   |   |       |   |   |   |   |   |        |  |
| 577 | and consists of observations collected from clean unimpacted locations.  |   |   |   |   |       |   |   |   |   |   |        |  |
| 578 | The use of USL tends to provide a balance between false positives and false negatives provided the data                  |   |   |   |   |       |   |   |   |   |   |        |  |
| 579 | represents a background data set and when many onsite observations need to be compared with the BTV.                     |   |   |   |   |       |   |   |   |   |   |        |  |

| 652 |  |   |   |   |   |      |                |   |   |   |   |      |
| 653 | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20. |   |   |   |   |      |                |   |   |   |   |      |
| 654 | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers    |   |   |   |   |      |                |   |   |   |   |      |
| 655 | and consists of observations collected from clean unimpacted locations.  |   |   |   |   |      |                |   |   |   |   |      |
| 656 | The use of USL tends to provide a balance between false positives and false negatives provided the data                  |   |   |   |   |      |                |   |   |   |   |      |
| 657 | represents a background data set and when many onsite observations need to be compared with the BTV.                     |   |   |   |   |      |                |   |   |   |   |      |
| 658 |  |   |   |   |   |      |                |   |   |   |   |      |

|    |  |   |   |   |        |   |  |   |   |   |        |   |

| 148 | Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)                                  |   |   |   |       |        |   |   |   |   |       |        |
| 149 | Order of Statistic, r  |   |   |   |       | 28     | 95% UTL with95% Coverage                                  |   |   |   |       | 5      |
| 150 | Approx, f used to compute achieved CC  |   |   |   |       | 1.474  | Approximate Actual Confidence Coefficient achieved by UTL |   |   |   |       | 0.762  |
| 151 | Approximate Sample Size needed to achieve specified CC   |   |   |   |       | 59     | 95% UPL   |   |   |   |       | 4.55   |
| 152 | 95% USL  |   |   |   |       | 5      | 95% KM Chebyshev UPL                                      |   |   |   |       | 1.848  |
| 153 |  |   |   |   |       |        |   |   |   |   |       |        |
| 154 | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20. |   |   |   |       |        |   |   |   |   |       |        |
| 155 | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers    |   |   |   |       |        |   |   |   |   |       |        |
| 156 | and consists of observations collected from clean unimpacted locations.  |   |   |   |       |        |   |   |   |   |       |        |
| 157 | The use of USL tends to provide a balance between false positives and false negatives provided the data                  |   |   |   |       |        |   |   |   |   |       |        |
| 158 | represents a background data set and when many onsite observations need to be compared with the BTV.                     |   |   |   |       |        |   |   |   |   |       |        |
| 159 |  |   |   |   |       |        |   |   |   |   |       |        |

| 224 | Approx, f used to compute achieved CC  |   |   |   |   | 1.474 | Approximate Actual Confidence Coefficient achieved by UTL |   |   |   |   | 0.762 |
| 225 |  |   |   |   |   |       | Approximate Sample Size needed to achieve specified CC    |   |   |   |   | 59    |
| 226 | 95% Percentile Bootstrap UTL with 95% Coverage   |   |   |   |   | 72.2  | 95% BCA Bootstrap UTL with 95% Coverage                   |   |   |   |   | 72.2  |
| 227 | 95% UPL  |   |   |   |   | 69.86 | 90% Percentile  |   |   |   |   | 65.27 |
| 228 | 90% Chebyshev UPL  |   |   |   |   | 104.9 | 95% Percentile  |   |   |   |   | 66.86 |
| 229 | 95% Chebyshev UPL  |   |   |   |   | 139.4 | 99% Percentile  |   |   |   |   | 70.8  |
| 230 | 95% USL  |   |   |   |   | 72.2  |   |   |   |   |   |       |
| 231 |  |   |   |   |   |       |   |   |   |   |   |       |
| 232 | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.   |   |   |   |   |       |   |   |   |   |   |       |
| 233 | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers      |   |   |   |   |       |   |   |   |   |   |       |
| 234 | and consists of observations collected from clean unimpacted locations.  |   |   |   |   |       |   |   |   |   |   |       |
| 235 | The use of USL tends to provide a balance between false positives and false negatives provided the data                    |   |   |   |   |       |   |   |   |   |   |       |
| 236 | represents a background data set and when many onsite observations need to be compared with the BTV.                       |   |   |   |   |       |   |   |   |   |   |       |

| 393 | Data appear to follow a Discernible Distribution at 5% Significance Level  |   |   |   |       |   |   |   |   |   |   |       |
| 394 |  |   |   |   |       |   |   |   |   |   |   |       |
| 395 | Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)                                    |   |   |   |       |   |   |   |   |   |   |       |
| 396 | Order of Statistic, r  |   |   |   | 28    | 95% UTL with95% Coverage                                  |   |   |   |   |   | 42.2  |
| 397 | Approx, f used to compute achieved CC  |   |   |   | 1.474 | Approximate Actual Confidence Coefficient achieved by UTL |   |   |   |   |   | 0.762 |
| 398 | Approximate Sample Size needed to achieve specified CC   |   |   |   | 59    | 95% UPL   |   |   |   |   |   | 33.06 |
| 399 | 95% USL  |   |   |   | 42.2  | 95% KM Chebyshev UPL                                      |   |   |   |   |   | 42.27 |
| 400 |  |   |   |   |       |   |   |   |   |   |   |       |
| 401 | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.   |   |   |   |       |   |   |   |   |   |   |       |
| 402 | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers      |   |   |   |       |   |   |   |   |   |   |       |
| 403 | and consists of observations collected from clean unimpacted locations.  |   |   |   |       |   |   |   |   |   |   |       |
| 404 | The use of USL tends to provide a balance between false positives and false negatives provided the data                    |   |   |   |       |   |   |   |   |   |   |       |
| 405 | represents a background data set and when many onsite observations need to be compared with the BTV.                       |   |   |   |       |   |   |   |   |   |   |       |

| 543 |  |   |   |   |       |   |   |   |   |   |   |        |
| 544 | Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)                                  |   |   |   |       |   |   |   |   |   |   |        |
| 545 | Order of Statistic, r  |   |   |   | 28    | 95% UTL with95% Coverage                                  |   |   |   |   |   | 1.65   |
| 546 | Approx, f used to compute achieved CC  |   |   |   | 1.474 | Approximate Actual Confidence Coefficient achieved by UTL |   |   |   |   |   | 0.762  |
| 547 | Approximate Sample Size needed to achieve specified CC   |   |   |   | 59    | 95% UPL   |   |   |   |   |   | 1.286  |
| 548 | 95% USL  |   |   |   | 1.65  | 95% KM Chebyshev UPL                                      |   |   |   |   |   | 2.077  |
| 549 |  |   |   |   |       |   |   |   |   |   |   |        |
| 550 | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20. |   |   |   |       |   |   |   |   |   |   |        |
| 551 | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers    |   |   |   |       |   |   |   |   |   |   |        |
| 552 | and consists of observations collected from clean unimpacted locations.  |   |   |   |       |   |   |   |   |   |   |        |
| 553 | The use of USL tends to provide a balance between false positives and false negatives provided the data                  |   |   |   |       |   |   |   |   |   |   |        |
| 554 | represents a background data set and when many onsite observations need to be compared with the BTV.                     |   |   |   |       |   |   |   |   |   |   |        |

|     |  |   |       |   |                    |       |   |   |       |   |   |        |  |  |
|-----|--|---|-------|---|--------------------|-------|---|---|-------|---|---|--------|--|--|
|     | A  | B | C     | D | E                  | F     | G | H   | I     | J | K | L      |  |  |
| 649 |  |   |       |   |                    |       |   |   |       |   |   |        |  |  |
| 650 | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20. |   |       |   |                    |       |   |   |       |   |   |        |  |  |
| 651 | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers    |   |       |   |                    |       |   |   |       |   |   |        |  |  |
| 652 | and consists of observations collected from clean unimpacted locations.  |   |       |   |                    |       |   |   |       |   |   |        |  |  |
| 653 | The use of USL tends to provide a balance between false positives and false negatives provided the data                  |   |       |   |                    |       |   |   |       |   |   |        |  |  |
| 654 | represents a background data set and when many onsite observations need to be compared with the BTV.                     |   |       |   |                    |       |   |   |       |   |   |        |  |  |

| 721 |  |                   |       | Approximate Sample Size needed to achieve specified CC    |       |   |   |   |   |   | 59    |
| 722 | 95% Percentile Bootstrap UTL with  | 95% Coverage      | 570   | 95% BCA Bootstrap UTL with 95% Coverage                   |       |   |   |   |   |   | 570   |
| 723 |  | 95% UPL           | 549.8 | 90% Percentile  |       |   |   |   |   |   | 439.3 |
| 724 |  | 90% Chebyshev UPL | 853.4 | 95% Percentile  |       |   |   |   |   |   | 495.3 |
| 725 |  | 95% Chebyshev UPL | 1112  | 99% Percentile  |       |   |   |   |   |   | 557.9 |
| 726 |  | 95% USL           | 570   |   |       |   |   |   |   |   |       |
| 727 |  |                   |       |   |       |   |   |   |   |   |       |
| 728 | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.   |                   |       |   |       |   |   |   |   |   |       |
| 729 | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers      |                   |       |   |       |   |   |   |   |   |       |
| 730 | and consists of observations collected from clean unimpacted locations.  |                   |       |   |       |   |   |   |   |   |       |
| 731 | The use of USL tends to provide a balance between false positives and false negatives provided the data                    |                   |       |   |       |   |   |   |   |   |       |
| 732 | represents a background data set and when many onsite observations need to be compared with the BTV.                       |                   |       |   |       |   |   |   |   |   |       |
| 733 |  |                   |       |   |       |   |   |   |   |   |       |
| 734 | Mercury  |                   |       |   |       |   |   |   |   |   |       |

| 799 | Theta hat (MLE)   |   |   |   |   | 11.68 | Theta star (bias corrected MLE)                                 |   |   |   |   | 15.04  |
| 800 | nu hat (MLE)  |   |   |   |   | 50.06 | nu star (bias corrected)  |   |   |   |   | 38.87  |
| 801 | MLE Mean (bias corrected)   |   |   |   |   | 24.36 |   |   |   |   |   |        |
| 802 | MLE Sd (bias corrected)   |   |   |   |   | 19.14 | 95% Percentile of Chisquare (2kstar)                            |   |   |   |   | 8.226  |
| 803 |   |   |   |   |   |       |   |   |   |   |   |        |
| 804 | Gamma ROS Statistics using Imputed Non-Detects  |   |   |   |   |       |   |   |   |   |   |        |
| 805 | GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs                              |   |   |   |   |       |   |   |   |   |   |        |
| 806 | GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20) |   |   |   |   |       |   |   |   |   |   |        |
| 807 | For such situations, GROS method may yield incorrect values of UCLs and BTVs  |   |   |   |   |       |   |   |   |   |   |        |
| 808 | This is especially true when the sample size is small.  |   |   |   |   |       |   |   |   |   |   |        |
| 809 | For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates               |   |   |   |   |       |   |   |   |   |   |        |
| 810 | Minimum   |   |   |   |   | 0.01  | Mean  |   |   |   |   | 10.52  |

|     |   |   |   |   |       |       |   |   |   |   |       |       |

| 871 | Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)                                  |   |   |   |       |   |         |   |   |   |        |       |
| 872 | Order of Statistic, r  |   |   |   | 28    | 95% UTL with 95% Coverage                                 |         |   |   |   | 55.8   |       |
| 873 | Approx, f used to compute achieved CC  |   |   |   | 1.474 | Approximate Actual Confidence Coefficient achieved by UTL |         |   |   |   | 0.762  |       |
| 874 | Approximate Sample Size needed to achieve specified CC   |   |   |   | 59    | 95% UPL   |         |   |   |   | 52.38  |       |
| 875 | 95% USL  |   |   |   | 55.8  | 95% KM Chebyshev UPL                                      |         |   |   |   | 79.59  |       |
| 876 |  |   |   |   |       |   |         |   |   |   |        |       |
| 877 | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20. |   |   |   |       |   |         |   |   |   |        |       |
| 878 | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers    |   |   |   |       |   |         |   |   |   |        |       |
| 879 | and consists of observations collected from clean unimpacted locations.  |   |   |   |       |   |         |   |   |   |        |       |
| 880 | The use of USL tends to provide a balance between false positives and false negatives provided the data                  |   |   |   |       |   |         |   |   |   |        |       |
| 881 | represents a background data set and when many onsite observations need to be compared with the BTV.                     |   |   |   |       |   |         |   |   |   |        |       |
| 882 |  |   |   |   |       |   |         |   |   |   |        |       |
| 883 | Radium   |   |   |   |       |   |         |   |   |   |        |       |

|------|--|---|---|---|-------|---|---|---|---|--------|---|---|
|      | A  | B | C | D | E     | F   | G | H | I | J      | K | L |
| 1135 |  |   |   |   |       |   |   |   |   |        |   |   |
| 1136 | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20. |   |   |   |       |   |   |   |   |        |   |   |
| 1137 | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers    |   |   |   |       |   |   |   |   |        |   |   |
| 1138 | and consists of observations collected from clean unimpacted locations.  |   |   |   |       |   |   |   |   |        |   |   |
| 1139 | The use of USL tends to provide a balance between false positives and false negatives provided the data                  |   |   |   |       |   |   |   |   |        |   |   |
| 1140 | represents a background data set and when many onsite observations need to be compared with the BTV.                     |   |   |   |       |   |   |   |   |        |   |   |

| 1259 | Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)                                    |   |   |   |       |   |   |   |   |   |   |       |
| 1260 | Order of Statistic, r  |   |   |   | 28    | 95% UTL with95% Coverage                                  |   |   |   |   |   | 45    |
| 1261 | Approx, f used to compute achieved CC  |   |   |   | 1.474 | Approximate Actual Confidence Coefficient achieved by UTL |   |   |   |   |   | 0.762 |
| 1262 | Approximate Sample Size needed to achieve specified CC   |   |   |   | 59    | 95% UPL   |   |   |   |   |   | 39.92 |
| 1263 | 95% USL  |   |   |   | 45    | 95% KM Chebyshev UPL                                      |   |   |   |   |   | 69.61 |
| 1264 |  |   |   |   |       |   |   |   |   |   |   |       |
| 1265 | Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.   |   |   |   |       |   |   |   |   |   |   |       |
| 1266 | Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers      |   |   |   |       |   |   |   |   |   |   |       |
| 1267 | and consists of observations collected from clean unimpacted locations.  |   |   |   |       |   |   |   |   |   |   |       |
| 1268 | The use of USL tends to provide a balance between false positives and false negatives provided the data                    |   |   |   |       |   |   |   |   |   |   |       |
| 1269 | represents a background data set and when many onsite observations need to be compared with the BTV.                       |   |   |   |       |   |   |   |   |   |   |       |
| 1270 |  |   |   |   |       |   |   |   |   |   |   |       |
| 1271 | Thallium   |   |   |   |       |   |   |   |   |   |   |       |
| 1272 |  |   |   |   |       |   |   |   |   |   |   |       |
| 1273 | General Statistics   |   |   |   |       |   |   |   |   |   |   |       |
| 1274 | Total Number of Observations   |   |   |   | 28    | Number of Missing Observations                            |   |   |   |   |   | 3     |
| 1275 | Number of Distinct Observations  |   |   |   | 6     |   |   |   |   |   |   |       |
| 1276 | Number of Detects  |   |   |   | 0     | Number of Non-Detects                                     |   |   |   |   |   | 28    |
| 1277 | Number of Distinct Detects   |   |   |   | 0     | Number of Distinct Non-Detects                            |   |   |   |   |   | 6     |
| 1278 | Minimum Detect   |   |   |   | N/A   | Minimum Non-Detect  |   |   |   |   |   | 0.1   |
| 1279 | Maximum Detect   |   |   |   | N/A   | Maximum Non-Detect  |   |   |   |   |   | 5     |
| 1280 | Variance Detected  |   |   |   | N/A   | Percent Non-Detects                                       |   |   |   |   |   | 100%  |
| 1281 | Mean Detected  |   |   |   | N/A   | SD Detected   |   |   |   |   |   | N/A   |
| 1282 | Mean of Detected Logged Data   |   |   |   | N/A   | SD of Detected Logged Data                                |   |   |   |   |   | N/A   |
| 1283 |  |   |   |   |       |   |   |   |   |   |   |       |
| 1284 | Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!                |   |   |   |       |   |   |   |   |   |   |       |
| 1285 | Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!          |   |   |   |       |   |   |   |   |   |   |       |
| 1286 | The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV). |   |   |   |       |   |   |   |   |   |   |       |
| 1287 |  |   |   |   |       |   |   |   |   |   |   |       |
| 1288 | The data set for variable Thallium was not processed!  |   |   |   |       |   |   |   |   |   |   |       |
| 1289 |  |   |   |   |       |   |   |   |   |   |   |       |
| 1290 |  |   |   |   |       |   |   |   |   |   |   |       |
